

# Pyramix native 5

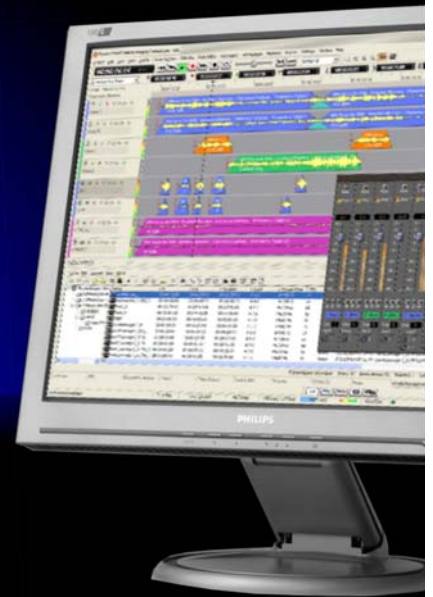

DIGITAL AUDIO WORKSTATION

## For Radio Broadcasters

Pyramix 'Native 5' and 'Native 5 Media Bundle' are the latest additions to the Pyramix family of audio workstations. 'Native' means they are specifically designed to operate on any Windows XP™ desktop or laptop PC using the computers on-board audio engine or ASIO compatible audio card.

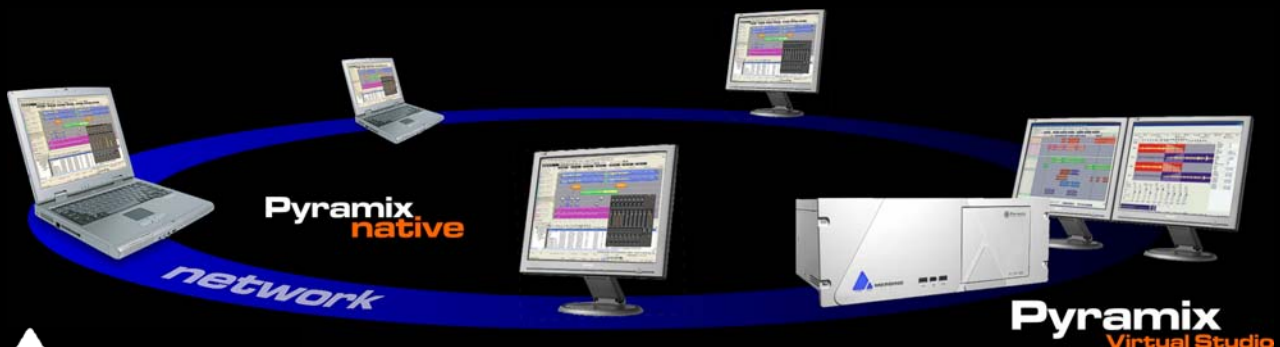

### Key Features

- Up to 8 inputs and 8 outputs
- Up to 24 editing tracks
- A new streamlined and intuitive user interface
- Real-time Editing, Processing and Mixing
- Standard audio formats include: WAV, BWF, AIFF, SD2, MP3, OMF.
- AAF Project Interchange Option
- 100% compatible with Pyramix Virtual Studio

Pyramix Native is configured for Broadcasters who require a software only solution for their laptop and desktop PC's. This is a new very cost-effective, yet professional, option that is 100% compatible with Merging Technologies' high-end multi-track Pyramix Virtual Studio system.

Pyramix Native is one of the most affordable solutions available while retaining an unparalleled audio quality and the highly efficient operational functionality expected of a professional system. Broadcasters can now afford to install multiple seats of Pyramix Native that can be networked using any existing Windows based office network. Pyramix Virtual Studio can also be integrated just as easily to the same network to give direct access to all audio media and project data with total compatibility.

# Pyramix

## native 5

DIGITAL AUDIO WORKSTATION

Pyramix Native can be configured with 2, 4 or 8 inputs and outputs and optionally up to 24 editing tracks. With a much simplified Pyramix recognizable user interface, which has been optimized for single screen operation, it makes best use of the Windows drag and drop, copy and paste methodology, so if you know Windows you will know how to use Pyramix Native.

Importantly, Pyramix 'Native' retains all the real-time editing and mixing capability of the main Pyramix VS system with real-time factory plug-ins for EQ, Dynamics, Delay, Metering and more. A Range of high quality 3rd party plug-ins is also available such as reverb, CEDAR Audio's audio restoration suite, time/pitch scaling and the system is compatible with Direct-X and VST plug-ins.

The use of a small Merging key ring USB dongle activates the Pyramix 'Native' system, so the Native software can be installed on a number of laptop and desktop computers and you simply insert the dongle in whichever system you need. This allows you to work from home, on location with a laptop and in the office or studio with a single installation of the software.

A separate USB or FireWire HD drive can also be connected for laptop location recording. Simply connecting it to the desktop PC, the project will reappear exactly the way it was saved.

A unique feature of Pyramix is its generic compatibility with almost all audio formats including WAV, BWF, AIFF, SD2, MP3, OMF and more. No conversion is necessary, the system will simply open and play whatever audio format you have, or decide to use. A range of optional interchange formats including AAF, OMF, Open TL and AES31 also allows direct project interchange with almost all other none Pyramix based systems such as Protools, Sadie, Sequoia, Nuendo and many many others.

A small sample list from around the world of Radio Broadcasters already using Pyramix Virtual Studio and Pyramix Native.
